

How to find issues where company has/hasn't other issues?

Sometimes we want to find issues, where company has or hasn't other issues. For example, at Teamlead we have projects Deals. There we track **Deals** (issues). And we have another project - Hosting, where we track hosting **Instances** (issues). So, we want to see Instances, which have no any Deals in status Delivery to control payments etc.

To resolve this requirement we've add special JQL operator into CRM:

```
id not in issuesByField(Company, "ANY JQL")
```

Let's have a look at full example of JQL:

```
project = HOSTING AND issuetype = Instance AND status = Работает AND "Режим работы" = Промышленный AND id not in issuesByField  
(Company, "project = DEAL AND issuetype = Deal AND status = Delivering AND Department = {{119}}")
```
